The major compound found in the foot of *Xenopus laevis* is the 20,25-lactone of 22,23-epoxycholesta-5,8,11,13(19)-tetraen-3-ol (luciferone). It is hydrolyzed under acidic conditions, or by enzymatic conversion into a thermodynamically less stable 21-ol. Other minor components include some tetraenoic derivatives and a recently reported unidentified compound, XL-1, that has a structure closely resembling that of the 22-chloro-22,23-epoxycholestane. All compounds are bound by the mineralized dermal tissues.

Q: Why it is not possible to access the getters of a function? I tried to access the getters of a function, I did so with the following code: `function(){ console.log(this.getName()); }` When I executed the code, I got the following error: `Uncaught TypeError: this.getName is not a function` What is going wrong here? A: you can access the getters, you just have to invoke them on the object. `this.getName(); function(){ console.log(this.getName()); } var obj = new MyObject(); obj.getName();` However, in your case you cannot access the getter because you have no instance of `MyObject`. `var obj = new MyObject(); function(){ console.log(obj.getName()); // This will not work. }` A: As the other answers have stated, you can't call a function from the global scope, such as this. This works, but you need to have an object as a context for your methods: `var obj = new MyObject(); function(){ console.log(obj.getName()); }` What is going wrong here? Objects (and in this case, function instances) are scoped to the global scope. You don't need to make your own scope 2d92ce491b
