Solution Manual for How to Prove It: A Structured Approach, 3rd Edition, Daniel J. Velleman, Amherst College, Massachusetts, ISBN-10: . I'm using a good option (as i have found out by now) i.e., to write every single problem as a section in my document, and use \subsection* for the title of the sections. A: Here's my solution for the first two exercises (sorry the links are dead): Suppose we wish to prove the following proposition (but not in formal proof, rather in ordinary English!): We write out the definition of a sentence in English: We then write out the definition of 'proves' in English: We now need to find a set of premises that entails this sentence. To do this we must apply the definition of 'entails' (which is also written in English): To do this we need to take the expression that follows the definition of entails (which is also written in English): We then need to find a list of sentences that is true by virtue of what we know, as per the definition of entail: We next take those sentences, but this time we drop the 'now' because it is not actually needed and 'entail' is always an 'if and only if' relationship. We then need to write the 'finally' (in English) sentence that we have just produced. Which leads us to write the whole of the proof as in the following picture: (For the purposes of the exercise, I'm not making any attempt to be 'artistic' or at all pretty, just trying to get my head around what I am doing) Now, what I didn't do in the above was explain why the 'if and only if' sentence was important. A good way to do this is to re-phrase the sentence in 2d92ce491b
