For example, sometimes people will encounter a problem in C# where they want to create a class for something that they think could do something simple. For example, they want a class that will evaluate a mathematical expression and return the result. In this case, the "roll your own" approach is to make something simple that will evaluate the expression and return the result: public static decimal Evaluate(string expression) { decimal result = 0; var parts = expression.Split(','); switch (parts[0]) { case "+": result = parts[1] + parts[2]; break; case "\*": result = parts[1] \* parts[2]; break; case "-": result = parts[1] - parts[2]; break; case "/": result = parts[1] / parts[2]; break; default: return 0; } }
