NetResults Pro is a advanced
TCP/IP utility that helps you
to make a complete, easy-to-
use network testing
environment. It has an
intuitive and friendly user
interface which provides the
most common network

testing tools all in one convenient location.

NetResults Pro will run on your PC in a terminal-like environment. You will be able to test protocols like TCP/IP, UDP, DNS, DHCP, FTP, PORT, POP3, SMTP, GATEWAY, POP, IIS, SOCKS, SSH, VNC, SFTP, RDP, HTTP and many others. Your tests will be saved in a simple, quick to view tabbed and color-coded display. You can run your tests as many times as you

want and export the results to an Excel, CSV or TXT file for easy analysis. With NetResults Pro, you will be able to: ✓ Run tests from local or remote computers. ✓ Run tests with multiple protocols, or single ones. ✓ Save results to CSV and TXT files. ✓ Test IPv4 and IPv6 addresses, hosts, domains, sub-domains and private networks. ✓ Find hosts and networks with a particular port or protocols. ✓ Scan hosts and networks

without internet connection
using UPnP. ✓ Run tests
through a browser window
with a Web Proxy. ✓ Show
scanned hosts in the System
Tray to enable scheduled
scans and remote control. ✓
Check IP addresses and
names resolved in DNS. ✓
Analyze and export results to
CSV and TXT files. The

Advanced LAN Scanner Keygen Full Version Free Download

KeyMacro is a simple yet extremely useful utility that can capture keyboard keys to any text file or clipboard. KeyMacro supports a large

variety of actions on the keyboard keys. You can record the keyboard events as they occur, record the last played event from an input file or clipboard, record a series of events from a file or clipboard, start recording events from the last played event or the current keystrokes, stop recording the event or stop recording the last played event and the current keystrokes.

KeyMacro lets you define the number of keys to be

captured, the name of the recording file, the recording mode and the number of repetitions per each event. KEYMACRO supports more than 600 action possibilities. KeyMacro allows you to record the keys pressed in the current session or at the time you launched the program. The application can also switch automatically between the session and last played event when recording, when the recorded file is over or the

active input file is cleared. The whole operation is very intuitive. You start by creating a recording file. The File Format dialog enables you to choose which type of file you want to record your events. If you want to record the events from the file, you simply select it from the list and press the "Start recording events from the last played" button. If you want to record the events from the Clipboard, choose it from

the list and press the "Start recording events from the Clipboard". The last used event is the currently active event in the recorded file. You can choose to record it and start the recording, or stop the recording and switch to the last used event. KeyMacro also supports the "Auto" recording mode that starts recording the last played event when you launch the program. When you are done recording your events, you can stop

recording, clear the file, switch to the last played event or to the current keystrokes. You can also choose to send your recording to the Clipboard or to a file on disk.

KeyMacro also supports the Auto Stop Recording feature. When you launch the program, the "Auto Stop recording" button starts automatically recording the last played event. Press the "Auto Stop recording" button to stop recording.

EXAMPLE USAGE:

KeyMacro lets you record the last played event, the current keystrokes and the keys that you pressed. You can replay a keystroke with a new keystroke or capture all the keys pressed during the selected event 1d6a3396d6

Advanced LAN Scanner is a tiny and intuitive application that you can use to scan all computers available in your network. It supports multiple threads and can be easily figured out. After a brief setup procedure, you are greeted by a common window with a plain layout, where you can enter an IP range to scan on the network. Advanced LAN Scanner displays results

immediately and reveals the domain, open and closed ports, NetBIOS names, groups, users, shares, drives, the remote time of the day and Windows Registry entries for each found IP address, among other items. A few configuration settings are available through the Advanced screen. Thus, you can create a list of IP addresses to be used in the program, as well as specify the type of information to gather (e.g. OS type, shares,

drives, scan ports and transports, groups and users). All revealed information can be saved to a plain text document (TXT) or HTML file. More preferences can be found in the Options screen. For instance, you can establish the maximum number of threads, scan mode and thread priority level, attempt to scan computers that do not response to the Ping commands, as well as use single-threaded NetBIOS

names retrieval mode. The simple-to-use program requires a pretty low quantity of CPU and system memory, has a good response time and finishes a scanning job swiftly, without causing us any problems throughout our testing. The app did not hang, crash or pop up error dialogs.

Unfortunately, no recent updates have been made.

Nevertheless, thanks to its intuitive layout, Advanced LAN Scanner should please

the entire audience.
