

Mobo Player (2022)

Mobo is a player that supports two different plugins. One plugin is for sharing audio among devices. It's called the Audio Sharing plugin. The other one is for playing video files: the Video plugin. - The `MoboPluginComponent` extends the `MediaPlayerComponent`. This permits the recording of multiple audio streams and to output the audio playing one of those streams. - `MoboPlayer` has the ability to play video files directly from the file system, instead of reading files from the streams. - The `MoboPluginList` can store lists of audio and video files from the file system. - File manipulation and controls can be performed via a user interface with the 'create button'. - It can be added to other toolkits via a singleton. * Functions * About * History To support legacy applications, the first version of `Mobo` includes a `rtp plugin`. To support all the different functionalities with a unified API, the second version will have a new plugin API. And please feel free to access to the git: the source code of the application is also on BitBucket: *FAQ* *How to get the components? If you develop a visual studio application, you only need to download the code of `MoboPlayer`, and then you need only to add the reference of `MoboPlayer` and `MoboPluginAPI`. If you don't develop a visual studio application, you can use the "org.sur..." tag in the code or you can download the code of `MoboPlayer` from the BitBucket. *What does the tag "org.sur..." mean? It means the organization is called "Surio Project". For example, to add the BitBucket tag on this example: to you should write *Codes repo *License `Mobo Player` is open source software. Feel free to distribute
