All Photoshop image manipulation and editing is done with layers. In the normal timeline, you manipulate a specific layer to create a change. You use layer adjustments to apply a change to all the layers. The adjustment layers (or adjustment layers, if you prefer) are assigned to the layer adjustments layer. You can change the visibility or use of an adjustment layer. If you make an adjustment layer visible and then assign the layer to the adjustment layer, you can toggle the visibility of the adjustment layer at any time. In the Layers palette, you can create a new layer, apply it to an image, and manipulate it. You can apply a particular effect to a layer by using the layer effects. When editing a layer, you have various tools at your disposal to paint, draw, and create a matte. You can mix foreground and background colors for all the layers in an image. You can create a new layer in multiple ways. You can apply a series of vector masks to a layer. You can put a selection in a layer. You can paint with a brush, eraser, airbrush, or other vector tool. The Layers palette offers a wide variety of tools for you to work on layers. You can use an image file as a reference for the layer. You can also clip and trim a layer to another layer or to a template. You can use a layer's contents as a pattern. The layer style allows you to apply a particular style to a layer. You can place a pattern on a layer and apply it to the layer as a layer style. You can apply an effect to a layer. You can duplicate an image or a layer. You can copy a layer to a different layer. Q: JSoup connect to non existing user/password in HTML sign in form I'm trying to scrape the content of a website which uses a HTML sign in form but it has a vulnerability which allows you to not login if you provide the wrong user/pass. HTML: Javascript \$(document).ready(function () { \$('#username').blur(); }); Currently, I was able to identify the ID of the field, but I'm not sure how to pass the value on the password field so that I can make a POST request with the correct credentials. A: I would do it with the Http URLConnection API. The web request will be done with the POST method as the form submit is registered on the "login.php" server's URI. I will use Chrome to perform the request. The page is at in case you want to know what are the values of the login and passwd parameters. Patients with human immunodeficiency virus infection and esophageal candidiasis can present an unusual but life-threatening complication known as oropharyngeal candidiasis. In this disorder, conidiophores, the fungus's means of releasing asexual spores, are able to form in the oropharynx, causing extensive erosions. The number of cases of esophageal candidiasis in patients infected with human immunodeficiency virus is increasing. In severe cases, cicatrization of the oropharynx and esophagus occurs, and patients experience serious dysphagia. Antifungal therapy is complex because of the presence of systemic involvement and a high rate of drug resistance. Symptomatic treatment, including protection of the oropharynx, is the only form of therapy currently approved by the US Food and Drug Administration. The aims of the proposed project are to evaluate the safety and efficacy of a new, non-invasive, therapy for oropharyngeal candidiasis. The product, an oral prostaglandin E analog, is a well tolerated, bioavailable agent, which has been shown in a phase II clinical trial to be effective in treating oral candidiasis in healthy subjects. The prostaglandin analog, however, has never been assessed in a randomized, double-blind, placebo- controlled, crossover trial for the treatment of patients with oropharyngeal candidiasis. We therefore plan to conduct a randomized, double-blind, placebo-controlled, crossover trial to determine the safety and efficacy of an oral prostaglandin E analog in patients with esophageal candidiasis associated with human immunodeficiency virus infection and in whom esophageal candidiasis is refractory to therapy. Specifically, we will administer the prostaglandin E analog or placebo to patients with esophageal candidiasis for 2 weeks, and then switch to the other treatment for 2 weeks. The safety and efficacy of the prostaglandin E analog will be compared with those of the placebo. A total of 60 patients will be randomly assigned to one of three groups: group 1 will receive placebo, group 2 will receive oral prostaglandin E analog, and group 3 will receive both oral prostaglandin E analog and probenecid. The primary outcome measure will be the resolution of clinical disease after 2 weeks of treatment. The diagnosis of oropharyngeal candidiasis will be determined by microscopic examination of oropharyngeal secret
