Suitable for advanced users The application lets you better visualize your creation, with a large database of elements that can easily be dragged over the workspace

and arranged as you see fit. This does not mean that coding is left aside, because without it you won't be able to make functions trigger. Preview results and check for errors. There are a lot of elements to work with, each found in a dedicated tab and the application gives you the possibility to customize the way your space is used. What's more, while in the design view, side panels let you add commands to selected elements, with necessary creation and trigger code already implemented. You won't find everything inside the application, some degree of programming knowledge still being required. The code can be easily viewed and managed, but for quick error identification the application can be launched either as it is or with debugging so you know where to look. Support for other programming methods. Furthermore, the application comes in handy regardless of your preferred programming language. In spite of its name, you can insert entire projects or just elements from the application specific format, as well as Delphi, C++ and Borland. In conclusion Taking everything into consideration, we can say that C++Builder is definitely one of the applications you need to keep around if programming is your thing. Features put at your disposal manage to impress not only through number, but through

KEYMACRO is a software library that allows you to protect your application code. It ensures the application's safety and saves your data in case of an attack or other

issues. Using the library is very simple and requires only the installation of additional packages. All you have to do is insert a macro definition in the code where you need to protect it. Basic functions allow to generate a random password that will be used to protect the text data (such as HTML pages, rich texts, XML, JavaScript,...). The user can change the password at any time. There is a very convenient interface that allows you to see the code created by KEYMACRO and that you can use to add an additional layer of protection on your data. It also allows to see the password used and allows you to edit it. When the application is launched, there is a message that warns the user if the protection level is not adequate. If the user ignores the warning, the data is not protected. KEYMACRO is compatible with all Delphi, C++Builder and C++Builder XE6 applications. It is provided as a unit for Windows, Mac OS and Linux. It is delivered in 2 different versions: Standard and Pro.

What's more, the standard version allows you to download free trial version for testing. In this case, the program is protected with a free password of 4 characters. KEYMACRO can be used by individual developers or within an organization. It also works very well in the environment of e-commerce. KEYMACRO is

intended to be used in any application, whether you are a developer or not. What's more, the standard version includes all commercial licenses that come along with the purchase of the application. In this case, you receive an additional 4 characters for free. For more details, visit:

What makes a good tag cloud tag cloud is a high-quality word list in which every word that can appear in your tag cloud should be included. This is one of the most important factors. Each item needs to be tagged individually. A tag cloud will include no duplicated tags, but will also not miss words that are not included in the word list. Many applications use the same word list over and over, which means that if you add the same word over and over, the tag cloud will end up with several duplicates of the same word. This makes the tag cloud unreadable, not only for you, but also for the user. A tag cloud can be created with just a few tags, but if you end up with thousands, this can be a time-consuming task. Creating a good tag cloud is a pretty easy task if you take the time to do it properly. Your word list will play a very important role in the end result. Some high-quality word lists come with a built-in tag cloud. How to Create a Tag Cloud Step 1: The first

As such I have a pretty good understanding of the whole process. C++Builder is one of those packages that requires a lot of work. I always thought Delphi was a lot easier to work with than C++Builder, and that was just not the case. C++Builder has a lot going on, so you have to have a good understanding of it in order to know what you're doing, which makes it complicated to learn. The documentation, however, is one of the best in the market. It's so great to finally have something other than PHP or Ruby that I can use for professional purposes. It's almost like a whole other language. Not only that but it's even easier than Delphi. Well, I guess that's because there's a lot less to do in C++Builder than in Delphi. C++Builder is a good package, but it's a work in progress. It's probably the best package available on the market right now, but there's some issues that need to be fixed. The new version of C++Builder (6.0) is even more complicated than the previous version. I never thought it

would be so hard to learn how to use C++Builder. Before I knew it, I was confused. It didn't seem like it was doing what
