Note To get the most out of your online image sharing and online image backup sites, it's important to use them to their full potential. For instance, make sure that you upload your images to the site as you create them, so that you don't lose the image file when you close your software. When you've finished cropping and adjusting your images, you can save the image file in a way that your online sharing or backup site can handle. The image file is typically named with your camera or computer name, a date and time, and a few other digits, some of which may not mean anything to you. For instance, a file created on an early model laptop computer may have a camera name of _MY COMPUTER_ and a date of _06/27/10 12:30 PM_. The date and time digits are used in some ways to control access to images.

--- abstract: 'Numerical simulations suggest that the [*dynamics*]{} of cluster substructure formation is considerably different from the original "colder-first" picture. Recent observations of local velocity dispersions and substructure in galaxy clusters have a [*fluctuating*]{} substructure that is inconsistent with a universal, decaying halo. We study the consequences of these results by testing a [*generalization*]{} of the "colder-first" picture in which the Universe is voids are populated first and clusters subsequently. This picture is consistent with [*both*]{} the observed [*fluctuating*]{} substructure and the fluctuating velocity distribution observed in clusters. We further explore the concept of evolving subclumps as the result of "cross" interactions between clusters, and find that the [*character*]{} of these interactions changes rapidly as the clusters evolve. Two examples are discussed. First, a simple description of such interactions is presented, and found to result in a "bubbly" substructure containing shell-like and filament-like features. Second, the "delayed" halo assembly model is extended into the substructure formation regime to include processes that [*delayed*]{} the formation of substructure. We note that both of these models are consistent with the [*fluctuating*]{} dynamical evolution of cluster substructure.' author: - ']. Bryan, S. Sigurdsson' title: Dynamical Evolution of Subclumps in Clusters --- [***"Subclumps" are not "Cores" - When and How?***]{} -0.5cm We begin by noting that the distinction between "substructures" and "haloes" is based on the nature of their virialized state. The substructure may be forming while the halo is contracting, and hence would be expected to have a velocity dispersion similar to that of the parent cluster. However, if the substructure has already collapsed, the internal dynamics would be restricted by the cluster's own virialized state, and not by the larger scale distribution of matter. In either case, the substructure has already acquired the $\rho \sim r^{-2}$ behavior of the outer region of the cluster. We shall use this basic definition

It took five-and-a-half years. But now Auckland's last coal power station, at Takapuna, has finally closed, ending a dirty chapter in the lives of the locals who used to be able to breathe it in. The NZX 50 listed company, Mighty River Power, completed the process on Friday morning, closing the station and sending the plant into retirement. The last coal was burnt from the site on September 14, 2016. The reduction in emissions from coal is expected to be worth around \$30 million a year. Across the board the power company - which also runs Whakatane in Hawke's Bay and Tiwai Point in Wellington - lowered its carbon emissions between 2010 and 2015. It achieved this partly by switching its fleet from coal to oil and gas. ROSS GIBLIN/FAIRFAX NZ The Mighty River coal power station at Takapuna. Mighty River Power's chief executive Richard Hopkinson said there was "a big picture" to consider. "I think it's going to be a very important part of the New Zealand energy story in the years to come." He said the switch from coal to gas was a big part of the reason the emissions were down, but the station itself was also a factor. "It's huge for the local community in terms of jobs, because you had people there on payroll all the time - not just the staff at the plant. "The power station in Takapuna and the community here support each other. There are some great benefits." When the plant closed there were 800 workers on the payroll, double the number 10 years ago, and an additional 30 contractors. The last piece of coal was stockpiled on site before transport to the Westland Mine. At the mine site the plant was dismantled and recycled materials taken off site. The majority of the plant was recycled back in Auckland, but some remains were taken to the fuel storage tanks at the mine. Despite the closing, the mine is still open for business. Hopkinson said it was a great asset, but not sustainable for the long-term. "We've operated this for
