we take a look at the new Java language features and capabilities in Java 8, the world's most widely-used programming language. Java (recently renamed from Java 2 Enterprise Edition to Java 8) has received a huge number of updates, with many new features and capabilities replacing older ones. Java 8 brings with it a suite of language and runtime updates. By making language enhancements, the aim is to relax legacy programs and prepare for new applications. Java 8 Language Enhancements One of the biggest Java 8 language features is the adoption of

Lambda Expressions as a primary programming construct. These are anonymous inner classes that represent code without a name and with particular limits regarding repetition, scope, and storage duration. They are easy to use but have a slightly higher learning curve than traditional methods. In Java 8, Lambda Expressions are covered in greater detail compared to previous versions, and there are improvements in Java variables and switching. This is a significant performance improvement, as it reduces the number of boolean expression evaluations used to pick the default value. Java 8 also has powerful improvements to the ArrayList and Java Collections implementations. These changes are meant to reduce redundant code, speed up implementation, and resolve outstanding bugs. A Java 8 language feature that brings many people up in arms is the new @SafeVarargs construct. This method allows Java programmers to call a method

with variable arguments using a known number of slots. There are a number of protocols that can be used with that method that has many similarities to the well-known printf() method.

@SafeVarargs also removes the need for pre- and post-processing code for methods that accept variable arguments. This is a change that many people are accepting, as it allows for tighter coupling between the
