Virtual Breadboard is a powerful electronic simulation tool designed by Virtual Electronics Inc. Virtual Breadboard is a 3D simulator that allows you to build circuits using a 3D view of the actual breadboard. . Virtual breadboard will give you the simulator to understand how the breadboard works.. Double Row Pin Header and jumper connections .The present invention relates to the field of distributed computing systems and more particularly to the field of distributed processing of messages. Distributed systems are ones in which a plurality of entities (i.e., nodes) perform some task over a network and communicate their results to a common destination (i.e., a central computer, a computer managed by a manager, etc.). It is generally desirable for a distributed system to be able to handle as much as possible of the task and to be able to communicate results as quickly as possible with a minimum of latency. The need to make distributed computing systems scalable imposes design challenges which have not yet been fully resolved. A particular type of distributed computing system is the so-called "peer-to-peer" system. In a peer-to-peer system, the nodes are generally peers (i.e., equal partners in some action) and may communicate with each other directly rather than via a general-purpose network. Peer-to-peer systems provide a special kind of distributed system having properties which are different from more conventional distributed systems. In particular, in contrast to other distributed systems, the workload, as a whole, is split among the nodes and each node must perform a
